

ATM Intellect 6.0

Release notes

5 May 2014 marks the release by AxxonSoft of version 6.0 of its Intellect-based bank security system.

New in ATM-Intellect 6.0

User interface

In **ATM Intellect 6.0** if there is video data received from sensors by alarm, then it is indicated on the Control panel. The user can now disable the 'show received image' and 'playback received clip' settings and not miss the moment of getting the video data. If there are videos that have been downloaded but have not been viewed yet, then the object in the Control panel is colored orange. The operator can view the downloaded data.

In **ATM Intellect 6.0** when selecting the 'viewing live video' menu item on the Control panel, the notification warning about channel load appears. This notification can be disabled in the settings of the ATM Monitoring interface object.

ATM Intellect in the distributed configuration

The components of **ATM Intellect 6.0** (ATM-Intellect Pro, ATM-Intellect Workstation and ATM-Intellect Workstation TC) can now operate in the distributed configuration. All the components are to be configured locally.

ATM Event Capture

In **ATM Intellect 6.0** the ATM Event Capture module now supports the CEN/XFS standard version 3.20.
