

Monitoring 6.0

Release notes

5 May 2014 marks the release by AxxonSoft of version 6.0 of its Intellect-based **Monitoring** system.

New in Monitoring 6.0

User interface

In **Monitoring 6.0** if there is video data received from sensors by alarm, then it is indicated on the Control panel. The user can now disable the 'show received image' and 'playback received clip' settings and not miss the moment of getting the video data. If there are videos that have been downloaded but have not been viewed yet, then the object in the Control panel is colored orange. The operator can view the downloaded data.

In **Monitoring 6.0** when selecting the 'viewing live video' menu item on the Control panel, the notification warning about channel load appears. This notification can be disabled in the settings of the Monitoring interface object.

Bug fixes

In **Monitoring 6.0** the Agent of Control can operate in the distributed architecture: when creating the Agent of Control object other Agent of Control objects did not connect with the Server of Control after the first restart of computers where they were installed.
